

Phillip Lowe — Product Manager / AI Consultant Résumé

Product Owner | Automation Architect | AI System Validator

 plowe95@yahoo.com |  (501) 274-6231 |  systack.net |  Central Arkansas (Remote)

Summary

Product-minded systems architect with 2+ years designing AI-powered business automations from concept to deployment. I don't write code — I define what systems should do, specify how they should behave, and validate whether outputs match intent. Built SAOS, a multi-tier SaaS platform, by directing a 10-agent AI team (SOL, DOOBY, LOKI, and 7 others) to execute my vision. Strong written communicator. Clear evaluator. Systems thinker. Looking for a role where defining requirements and validating outcomes drives product quality.

What I Do

Product Definition - Translate business needs into clear system requirements - Write specs, user stories, and acceptance criteria - Define “done” — what success looks like before build starts

AI Orchestration & Validation - Direct multi-agent AI teams to build complex systems - Evaluate agent outputs against intent - Reject, redirect, and refine until outcomes match requirements - Debug failures by tracing intent → execution → output gaps

Quality Assurance (User Perspective) - Test systems as end-user, not engineer - Write clear bug reports that explain *why* something is wrong - Identify edge cases, inconsistencies, and user experience gaps - Validate that the thing built matches the thing specified

Documentation & Communication - Write technical manuals, API docs, and user guides - Explain complex systems in plain language - Maintain memory logs, decision records, and process documentation

Portfolio: SAOS (Systack Automation Operating System)

Product Owner & Architect — 2024–Present

The Product: Multi-tier SaaS dashboard for AI-powered business automation

My Role: - Defined all 8 dashboard tabs and their functionality - Specified 14 REST API endpoints (auth, tasks, services, activity, deliverables, exports) - Designed Stripe billing integration (\$149–\$799/mo tiers) with webhook flow - Directed agent architecture: 10 specialized agents with distinct roles - Wrote evaluation criteria for agent task completion and trust scoring - Validated outputs: rejected 20+ iterations until UI/UX met intent - Documented: 5 PDF guides (Quick Start, User Guide, Service Manual, Architecture, Mobile Access)

The Team I Directed: - SOL (strategic oversight) | DOOBY (coding) | LOKI (background ops) - CODY (code review) | GENI (creative) | VALI (testing) - PESSI (monitoring) | CHATTY (communications) | ATLAS (research) | JURIS (compliance)

Tech Stack: Flask API, vanilla JS frontend, SQLite/Postgres, Stripe, n8n, OpenClaw, Ollama

Portfolio: Utopia Deli Ordering System

Automation Architect — 2024–2025

The Product: End-to-end food ordering pipeline (HTML form → payment → confirmation)

My Role: - Defined the order flow and user experience - Specified pricing logic (fixed critical double-charging bug by centralizing authority) - Validated Square payment integration and email confirmation flow - Directed build of mobile-responsive UI

Live at: utopia-deli.systack.net

Portfolio: Invoice Parser Automation

Product Owner — 2024

The Product: Automated invoice extraction from email → structured data
→ notification

My Role: - Defined the workflow: trigger → save → parse → log → notify -
Specified API contract for parser service - Validated accuracy with real
business invoices - Directed error handling and fallback logic

Previous Experience

Warehouse Operations

12 Years — Multi-site logistics (picking, routing, inventory, team lead)

- Developed systems-thinking by identifying manual inefficiencies and designing process improvements
- Trained new hires, maintained safety standards
- **Key insight:** The same “define → build → validate” loop scales from warehouse floors to software systems

Audio Engineering

Degree/Certification — Studio recording, mixing, live sound

- Creative background in rap/hip-hop performance
 - Developed ear for quality: knowing when something sounds “right” vs. “almost right”
 - **Parallel skill:** Validating AI outputs uses the same judgment — does this match the intent?
-

What Makes Me Effective

- **Intent-driven:** I start with “what should this do?” not “how do we build it?”
- **Clear communicator:** I write specs that builders can execute without ambiguity
- **Honest validator:** I reject work that doesn’t match requirements — no matter how much effort went in

- **Systems thinker:** I catch when a small error in one component breaks the whole user experience
 - **Documentation discipline:** Every decision is recorded, every process is documented
-

Tools I Work With

Product & Communication - Markdown, Google Docs, Notion, Obsidian - GitHub (issue tracking, project management) - n8n (workflow logic, not coding)

AI Platforms - OpenClaw (agent orchestration) - Ollama (local LLM management) - ChatGPT, Claude (validation and ideation)

Business - Stripe (billing logic, not implementation) - Square (payment flow design) - Cloudflare, Tailscale (deployment decisions)

Availability

- Fully remote, flexible schedule (available nights/weekends, CST timezone)
 - MacBook Air M2 (16GB), reliable internet
 - Comfortable with async communication and independent work
-

“I don’t build the system. I define what the system should be. Then I validate whether the builders got it right.”
