Error	Red	#ef4444

1. Overview

The Error Catcher is a cross-system error handling workflow that catches failures from all other n8n workflows and routes them appropriately — logging, alerting, and retrying where possible.

Workflow File: `n8n-workflows/error-catcher-master-v2.json`

2. System Architecture

```
Any workflow fails
  → Error Catcher receives error payload
  → Classify error type:
    ├── HTTP failure → Retry with backoff
    ├── Auth expired → Alert + pause workflow
    ├── Data validation → Log + notify
    ├── Timeout → Retry once
    └── Unknown → Log + alert
  → Log to error_log table
  → Notify via email/Slack if critical
```

3. Error Classification

ERROR TYPE	DETECTION	ACTION
HTTP 4xx	Status code 400–499	Log, alert if auth-related
HTTP 5xx	Status code 500–599	Retry x3 with exponential backoff
Timeout	Execution time > threshold	Retry once, then alert
Auth Expired	401 status	Alert immediately, pause workflow
Data Validation	Code node error	Log invalid data, continue
Unknown	Unclassified	Log full error, alert

4. Configuration

Retry Policy

CONDITION	ACTION	MAX ATTEMPTS
HTTP 5xx	Exponential backoff (1m, 5m, 15m)	3
Timeout	Immediate retry	1
Auth expired	No retry — alert only	0

Alert Thresholds

METRIC	THRESHOLD
Errors in 1 hour	> 5 → alert
Consecutive auth failures	> 1 → immediate alert
Same workflow failing	> 3 in 24h → pause workflow

5. Setup

- 1. Import `error-catcher-master-v2.json` into n8n
- 2. Set as “Error Workflow” in each production workflow’s settings
- 3. Configure notification channels (email/Slack)
- 4. Test: force an error, verify catch + log + alert
