Utopia Deli — Confirmation Email System

Internal Implementation Guide

Document ID: UD-CONF-IMPL-001

Version: 1.0

Status: Internal — Systack Only

Source System: Utopia Deli (Live since 2026-06-12)

Date: 2026-06-16

Builder: SOL / Assembly

Brand Reference

1. System Architecture

```
Customer Pays on Square
  → Square redirects to success page
  → Success page fires webhook
    → n8n receives webhook
      → Lookup order in DB
        → Build branded email
          → Send to customer
```

Dual Trigger Design:

```
Frontend Webhook ─┐
                   └─┬─> Route Trigger → DB Lookup → Continue
Square Webhook ─┐
```

Both triggers flow independently into the same processing pipeline. No merge node — avoids deadlock.

2. Core Components

Success Pages

PAGE	URL	FILE
Pickup Orders	order.theutopiadelivery.com/payment-confirmed/	payment-confirmed/index.html

PAGE	URL	FILE
Meal Prep	order.theutopiadeli.com/payment-confirmed-meal-prep/	payment-confirmed-meal-prep/index.html

Webhook Endpoints

ENDPOINT	SOURCE	PURPOSE
POST /webhook/utopia-confirmation-email	Frontend success page	Triggers receipt email
POST /webhook/utopia-square-webhook	Square	Payment confirmation trigger

n8n Workflow

File: utopia-confirmation-email-v3.json

Node Chain:

```

Webhook (Square or Frontend)
  → Normalize (parses payment.updated + COMPLETED)
  → Should Process? (IF $json.process === true)
    → Prep DB Lookup
      → Lookup Order in DB (SQLite)
      → Extract DB Row (array → object)
        → Order Exists? (IF error !== "NOT_FOUND")
          → Email Not Sent? (IF Number(email_sent) !== 1)
            → Build Order Data (parse cart_json)
              → Build Cart HTML (table)
                → Build Branded Email
                  → Email Exists? (IF email !== "")
                    → Send Email (Gmail SMTP)
                      → Mark Email Sent (UPDATE email_sent = 1)
                        → Respond ✅

```

Database Schema

```

CREATE TABLE IF NOT EXISTS orders (
  order_id TEXT PRIMARY KEY,
  customer_name TEXT,
  customer_email TEXT,
  customer_phone TEXT,
  cart_json TEXT,
  subtotal_cents INTEGER,
  tax_cents INTEGER,
  total_cents INTEGER,
  source TEXT, -- 'online-order' or 'meal-prep'
  email_sent INTEGER DEFAULT 0,
  email_sent_at DATETIME,
  created_at DATETIME DEFAULT CURRENT_TIMESTAMP
);

```

3. Setup Process (Replication)

Step 1 — Deploy Success Pages

- Copy `payment-confirmed/index.html` to client domain
- Copy `payment-confirmed-meal-prep/index.html` (if applicable)
- Update webhook endpoint URL in page JavaScript

Step 2 — Import n8n Workflow

- Import `utopia-confirmation-email-v3.json`
- Configure SQLite credential
- Configure SMTP credential
- Activate workflow

Step 3 — Configure Square Webhook

- Square Developer Dashboard → Webhooks
- Add subscription: Event `payment.updated`
- URL: `https://utopia-api.systack.net/webhook/CLIENT-square-webhook`

Step 4 — Update Checkout Redirect URLs

In the order intake workflow, update redirect URLs:

- Pickup: `https://order.client.com/payment-confirmed/?order_id={{order_id}}`
- Meal Prep: `https://order.client.com/payment-confirmed-meal-prep/?order_id={{order_id}}`

4. Critical Pitfalls (All Fixed in v3)

Pitfall 1: Merge Node Deadlock

Problem: Using `mergeByIndex` waits for both inputs simultaneously. Only one trigger fires → workflow stalls.

Fix: Remove merge node. Use direct parallel routing — both triggers flow independently into same downstream node.

Pitfall 2: SQLite Returns Array

Problem: SQLite node returns `[{row}]` but downstream expects `{row}`.

Fix: Add “Extract DB Row” Code node:

```
const rows = $json;
if (!rows || rows.length === 0) {
  return [{ json: { error: "NOT_FOUND" } }];
}
```

```
}  
return [{ json: rows[0] }];
```

Pitfall 3: email_sent Check Type Mismatch

Problem: `$json.email_sent !== "true"` compares integer to string.

Fix: Use `Number($json.email_sent || 0) !== 1`

Pitfall 4: Missing Order Handling

Problem: DB returns no rows → cascading errors.

Fix: Add “Order Exists?” IF node checking `$json.error === "NOT_FOUND"` .

Pitfall 5: Missing Email Guard

Problem: Empty email → SMTP error.

Fix: Add “Email Exists?” IF node checking `$json.email !== "" && $json.email !== null` .

5. Testing Procedure

Test Frontend Trigger

```
curl -X POST https://utopia-api.systack.net/webhook/utopia-confirmation-email \  
-H "Content-Type: application/json" \  
-d '{"order_id": "UD0-TEST-001", "source": "online-order"}'
```

Test Square Webhook

```
curl -X POST https://utopia-api.systack.net/webhook/utopia-square-webhook \  
-H "Content-Type: application/json" \  
-d '{  
  "type": "payment.updated",  
  "data": {  
    "object": {  
      "payment": {  
        "status": "COMPLETED",  
        "reference_id": "UD0-TEST-001"  
      }  
    }  
  }  
}'
```

6. Configuration Requirements

Credentials

CREDENTIAL	TYPE	PURPOSE
SQLite	n8n credential	Order lookup
SMTP (Gmail)	n8n credential	Email delivery

Database

- **File:** orders.db
- **Table:** orders
- **Key column:** email_sent (INTEGER DEFAULT 0)

7. Maintenance

- Monitor n8n execution log for failed email sends
- Check email_sent column for deduplication accuracy
- Verify Square webhook subscription is active
- Update success page copy as needed
